

# Implications for a Child when One Partner carries Alpha Zero Thalassaemia and the Other carries Haemoglobin C

*There is no particular problem for this couple.* This combination cannot cause an inherited anaemia in their children.

*In each pregnancy,* there are four possibilities:

- The child may not carry any haemoglobin disorder.
- The child may carry alpha zero thalassaemia. This is harmless.
- The child may carry Haemoglobin C. This is harmless.
- The child may inherit alpha zero thalassaemia from one parent and Haemoglobin C from the other. This is harmless.

This couple has the same chance of a healthy family as other couples.

*When the children grow up,* they should have blood test to see if they have inherited alpha zero thalassaemia or haemoglobin C. If they have, their partner should have a test "for haemoglobin disorders". It is important to remember this for the future.
