

## Implications for a Child when One Partner carries Haemoglobin C and the Other does not carry any Haemoglobin Disorder

*There is no particular problem for this couple.* This combination cannot cause a serious inherited anaemia in their children.

*In each pregnancy* there are two possibilities:

- The child may not carry any haemoglobin disorder.
- The child may carry haemoglobin C. This is harmless.

This couple has the same chance of a healthy family as other couples do.

**When the children grow up**, they should have blood test to see if they have inherited haemoglobin C. If they have, their partner should have a test "for haemoglobin disorders". It is important to remember this for the future.
