

Implications for a Child when One Partner carries Haemoglobin C and the Other carries Haemoglobin E

There is no particular problem for this couple. This combination cannot cause a serious anaemia in their children.

In each pregnancy, there are four possibilities:

- The child may not be a carrier at all
- The child may carry haemoglobin C. This is harmless.
- The child may carry Haemoglobin E. This is harmless.
- The child may inherit haemoglobin C from one parent and haemoglobin E from the other. This is harmless.

This couple has the same chance of a healthy family as other couples do.

When the children grow up, they should have blood test to see if they have inherited haemoglobin C or haemoglobin E. If they have, their partner should have a test "for haemoglobin disorders". It is important to remember this for the future.
