

Implications for a Child when Both Partners carry Haemoglobin D Punjab

There is no particular problem for this couple. This combination cannot cause an inherited anaemia in their children.

In each pregnancy, there are three possibilities:

- The child may not carry any haemoglobin disorder.
- The child may carry haemoglobin D Punjab. This is harmless.
- The child may inherit haemoglobin D Punjab from both parents. This child will have only haemoglobin D Punjab. This is harmless.

This couple has the same chance of a healthy family as other couples do.

When the children grow up, they should have blood test to see if they have inherited haemoglobin D Punjab. If they have, their partner should have a test "for haemoglobin disorders". It is important to remember this for the future.
