

Implications for a Child when Both Partners carry Hereditary Persistence of Fetal Haemoglobin (HPFH)

There is no particular problem for this couple, because this combination cannot cause an inherited anaemia in their children.

In each pregnancy, there are three possibilities:

- The child may not carry any haemoglobin disorder.
- The child may carry HPFH. This is harmless.
- The child may inherit HPFH from both parents. This is practically harmless.

This couple has the same chance of a healthy family as other couples do.

When the children grow up, they should have blood test to see if they have inherited HPFH. If they have, their partner should have a test "for haemoglobin disorders". It is important to remember this for the future.
