

Implications for a Child when One Partner carries Alpha plus Thalassaemia and the Other carries haemoglobin E

There is no particular problem for the couple. This combination cannot cause an inherited anaemia in their children.

In each pregnancy, there are four possibilities:

- The child may not carry any haemoglobin disorder.
- The child may carry alpha plus thalassaemia. This is harmless.
- The child may carry Haemoglobin E. This is harmless.
- The child may inherit alpha plus thalassaemia from one parent and Haemoglobin E from the other. This is harmless.

This couple has the same chance of a healthy family as other couples.

When the children grow up, they should have blood test to see if they have inherited haemoglobin E. If they have, their partner should have a test "for haemoglobin disorders". It is important to remember this for the future.
